

I believe that the FCC would be making a big mistake if it approved BPL to allow the power utility companies to transmit HF-VHF band signals through the electric power lines. The potential to cause interference with many existing licensed commercial radio services and Amateur radio is very great. BPL should be evaluated with a actual field test for a trial run in an area to determine the full impact to prove that it can coexist without causing harm to other radio service before being approved by the FCC.
